Data Sources

- **macro_liquidity**: Net liquidity and credit spread time series
- **market_ohlcv**: SPY daily closes

Key Findings

- stress: count=44 excess=-0.08% raw=+1.07% hit=84.1% p=0.001 ns
- extreme_stress: count=6 excess=-0.94% raw=+0.21% hit=83.3% p=0.482 *
- repair: count=33 excess=-0.04% raw=+1.11% hit=81.8% p=0.010 ns

Executive Summary

NOTE

Fiscal and liquidity impulse study. Measures SPY forward returns during liquidity stress, extreme stress, and repair regimes relative to an unconditional buy-and-hold baseline, with significance testing.

Results & Interpretation

- Across 44 events, the forward return for stress averaged +1.07%, vs a +1.15% baseline. That is a shortfall of -0.08 percentage points versus baseline. Returns were positive 84.1% of the time. The edge is not statistically significant ($p \approx 0.802$).
- Across 6 events, the forward return for extreme_stress averaged +0.21%, vs a +1.15% baseline. That is a shortfall of -0.94 percentage points versus baseline. Returns were positive 83.3% of the time. The edge is statistically significant at the 95% level ($p \approx 0.0177$).
- Across 33 events, the forward return for repair averaged +1.11%, vs a +1.15% baseline. That is a shortfall of -0.04 percentage points versus baseline. Returns were positive 81.8% of the time. The edge is not statistically significant ($p \approx 0.925$).

Objectives

NOTE

Evaluate whether the studied signal produces a measurable, repeatable edge.

Quantify the reliability of the observed patterns across the sample.

Methodology

Net liquidity 13-period percent change and credit spread z-scores computed over 52-period rolling window. Stress: $\text{liquidity_z} < -1$ or $\text{credit_z} > 1$. Extreme stress: $\text{liquidity_z} < -1.5$ and $\text{credit_z} > 1.5$. Repair: $\text{liquidity_z} > 1$ and $\text{credit_z} < 0$. Each contiguous regime run contributes one non-overlapping event; forward windows are 21 trading bars. Excess return is regime forward return minus the unconditional forward-return mean; significance via one-sample t-test, bootstrap 95% CI, and Welch test vs baseline.

Limitations

NOTE

Results are research-grade, not investment advice. The sample is limited to available data, and measured edges may not persist out-of-sample.

Table 1

Glossary

Term	Definition
n / count	Number of observations or events in the sample.
edge	Average excess return versus the unconditional baseline.
hit-rate	Share of events with a positive forward return.
p-value	Probability of observing the result under the null of no edge.
*** / ** / *	Significance at 99.9% / 99% / 95% confidence.
α (alpha)	Intercept or active return versus benchmark.
β (beta)	Sensitivity to a reference factor or market.
σ (sigma)	Volatility / standard deviation of returns.
