Data Sources

- **macro_revision_features**: Revision feature dataset for macro series
- **macro_revision_signals**: Revision signal dataset for macro series

Key Findings

- GDP: rev_3m=+9.4640
- INDPRO: rev_3m=-0.0869
- PAYEMS: rev_3m=-74.0000
- RSAFS: rev_3m=+3,171.0000
- UNRATE: rev_3m=-0.1000
- PAYEMS down: +0.69% excess (n=9, p=0.035 ns)

Executive Summary

NOTE

Macro revision momentum overview for GDP, INDPRO, PAYEMS, RSAFS, and UNRATE. Tracks 1-month and 3-month data revisions and regime signals, with forward SPY returns conditioned on revision direction.

Results & Interpretation

- Across 7 events, the forward return for up averaged -0.02%, vs a +1.15% baseline. That is a shortfall of -1.17 percentage points versus baseline. Returns were positive 57.1% of the time. The edge is not statistically significant ($p \approx 0.222$).
- Across 10 events, the forward return for down averaged +1.69%, vs a +1.15% baseline. That is an edge of +0.54 percentage points versus baseline. Returns were positive 80.0% of the time. The edge is not statistically significant ($p \approx 0.683$).
- Across 9 events, the forward return for down averaged +1.84%, vs a +1.15% baseline. That is an edge of +0.69 percentage points versus baseline. Returns were positive 88.9% of the time. The edge is not statistically significant ($p \approx 0.372$).
- Across 6 events, the forward return for up averaged +1.99%, vs a +1.15% baseline. That is an edge of +0.84 percentage points versus baseline. Returns were positive 66.7% of the time. The edge is not statistically significant ($p \approx 0.716$).
- Across 5 events, the forward return for down averaged +1.88%, vs a +1.15% baseline. That is an edge of +0.73 percentage points versus baseline. Returns were positive 100.0% of the time. The edge is not statistically significant ($p \approx 0.425$).

Objectives

NOTE

Evaluate whether the studied signal produces a measurable, repeatable edge.

Quantify the reliability of the observed patterns across the sample.

Methodology

Features loaded from macro_revision_features and macro_revision_signals datasets. 3M revision display falls back to last non-zero value when current revision is zero, with staleness tracking in months. Forward SPY returns over a trading-bar horizon (config, default 21) are measured following positive vs negative revision_3m observations; excess over the unconditional forward-return mean and one-sample t-test p-values are reported.

Limitations

NOTE

Results are research-grade, not investment advice. The sample is limited to available data, and measured edges may not persist out-of-sample.

Glossary

Term	Definition
n / count	Number of observations or events in the sample.
edge	Average excess return versus the unconditional baseline.
hit-rate	Share of events with a positive forward return.
p-value	Probability of observing the result under the null of no edge.
*** / ** / *	Significance at 99.9% / 99% / 95% confidence.
α (alpha)	Intercept or active return versus benchmark.
β (beta)	Sensitivity to a reference factor or market.
σ (sigma)	Volatility / standard deviation of returns.
